FOREWORD

The traffic volumes listed in this booklet are the Annual Average Daily Traffic (A.A.D.T.), Summer Average Daily Traffic (S.A.D.T.), Summer Average Weekday Traffic (S.A.W.D.T.), and Winter Average Daily Traffic (W.A.D.T.) figures for each of the sections of highway identified.

Definitions of these terms are as follows:

- A.A.D.T. - average two way daily traffic past a given point during the period from January 1 to December 31.
- S.A.D.T. - average two way daily traffic during the months of July and August, including weekends.
- S.A.W.D.T. - average two way daily traffic during July and August excluding the weekend, the weekend being from Friday noon to Monday noon.

Also shown for the first time is the Winter Average Daily Traffic (W.A.D.T.) which may be defined as:- the average two way daily traffic during the period from December 1 to March 31.

Local conditions may cause variations in the volume within the sections of highway listed, but on the whole, the sections are considered to be adequately represented by the volumes shown.

Seasonal fluctuations of traffic occur on almost all sections of highway, usually resulting in higher traffic volumes in the summer and lower traffic volumes in the winter. The amount of variation varies considerably from section to section, from highway to highway and from area to area. It is not possible to list all these variations for every section of highway and the A.A.D.T., S.A.D.T., S.A.W.D.T. and W.A.D.T. are given as an indication of the magnitude of fluctuations and are shown to provide additional information on traffic patterns and seasonal variations on each section.

The pattern number denotes the permanent counting station whose seasonal variation characteristics have been attributed to that highway section.

In a very general way, traffic volumes in Ontario are growing at the rate of about 5% per year. Obviously, local conditions will cause varying rates of growth to occur in different areas.

P R E F A C E

The Ministry of Transportation and Communications, in this publication, provides a summary of the traffic volumes and accident rates on the Provincial Highway Systems. The King's Highway which includes the Queen Elizabeth Way, the 400 Series of Highways, and Highways 2 to 144 are listed first. The Secondary Highways numbered from 500 to 666 are listed next beginning with page 188.

For the purpose of this book, highways are divided into short sections. The end points of the sections are described in the first column, "location description". The remaining columns give the following data for each section:

Miles:	The length of the section in miles and tenths of a mile.
P. C. S. No.	A code used by Ministry staff to indicate the variability of traffic flows.
A. A. D. T.	Annual average daily traffic; which is defined as the average twenty-four hour two-way traffic for the period January 1st to December 31st.
S. A. D. T.	Summer average daily traffic; which is defined as the average twenty-four hour, two-way traffic for the period July 1st to August 31st, including weekends.
S. A. W. D. T.	Summer average weekday daily traffic; which is defined as the average twenty-four hour two-way weekday traffic for the period July 1st to August 31st excluding weekends. Weekend traffic is deemed to start at noon on Friday; and end at noon on Monday for a normal short week-end, or end at noon on Tuesday for a long holiday weekend.
W. A. D. T.	Winter average daily traffic; which is defined as the average twenty-four hour two-way traffic for the period December 1st to March 31st, including weekends.
A. R.	Accident rate; which is defined as the number of accidents per million vehicle miles of travel for the period January 1st to December 31st.

Measuring traffic flows for the Province of Ontario is a major task. Systematic samples of existing traffic flows are obtained throughout the year, and the traffic volumes in this book have been calculated using accepted mathematical methods. It should be emphasized that the values given are estimates based on samples and not the result of massive continuous counting which would be prohibitive in cost.

P R E F A C E

The Ministry of Transportation and Communications, in this publication, provides a summary of the traffic volumes and accident rates on the Provincial Highway Systems. The King's Highway, which includes the Queen Elizabeth Way, the 400 Series of Highways, and Highways 2 to 169, are listed first. The Secondary Highways, numbered from 500 to 666, are listed next beginning with page 174.

For the purpose of this book, highways are divided into short sections. The end points of the sections are described in the first column, "location description". The remaining columns give the following data for each section:

Miles:	The length of the section in miles and tenths of a mile.
PATT TYPE:	The pattern type is used by Ministry staff to indicate the variability of traffic flows.
A.A.D.T.	Annual average daily traffic; which is defined as the average twenty-four hour two-way traffic for the period January 1st to December 31st.
S.A.D.T.	Summer average daily traffic; which is defined as the average twenty-four hour, two-way traffic for the period July 1st to August 31st, including weekends.
S.A.W.D.T.	Summer average weekday daily traffic; which is defined as the average twenty-four hour two-way weekday traffic for the period July 1st to August 31st excluding weekends. Weekend traffic is deemed to start at noon on Friday; and end at noon on Monday for a normal short week-end, or end at noon on Tuesday for a long holiday weekend.
W.A.D.T.	Winter average daily traffic; which is defined as the average twenty-four hour two-way traffic for the period December 1st to March 31st, including weekends.
A.R.	Accident rate; which is defined as the number of accidents per million vehicle miles of travel for the period January 1st to December 31st.

Measuring traffic flows for the Province of Ontario is a major task. Systematic samples of existing traffic flows are obtained throughout the year, and the traffic volumes in this book have been calculated using accepted mathematical methods. It should be emphasized that the values given are estimates based on samples and not the result of massive continuous counting which would be prohibitive in cost.
